

Mountains. The identification of this species has been confirmed by Prof. Fernald. *A. occidentalis* has been collected twice but in one case the material is not thoroughly characteristic and in the other it consists of difficultly identifiable staminate plants. The county is rather definitely Alleghanian in its plant life, as has been shown through an intensive study of the flora for a number of years, and the occurrence of *A. canadensis*, which Mr. Long in his article has shown to be of Canadian association, is hardly to be expected here unless it be found to occur as an isolated extension, as is apparently the case in the county with the above mentioned species.

The Mauch Chunk region, however, contains a much more definite Canadian element in its plant associations. *A. canadensis* occurs there in at least three stations while careful search has not revealed its presence in Lehigh county. *A. Parlinii*, though, has been collected only at a single station near Mauch Chunk, and none has been noted in the mountain country explored to the northward, but its wide distribution in Lehigh county is known by a series of collections from the vicinity of the Kittatinny mountains in the extreme north to the upper Perkiomen Valley in the extreme southern portion. All this is rather suggestive of the correctness of Mr. Long's understanding of the life associations of these plants.

ALLENTOWN, PENNSYLVANIA.
